Financial Hideout

Helping traders fast-track their journey to profitability.
Thank you again for being a part of the journey.

Market Structure Introduction:

In this short guide, I'm going to teach you my approach to one of the most important concepts a trader can learn when it comes to analysing price charts, which is Market Structure.

It doesn't matter what market you're trading or what strategy you're using if you do not understand market structure you're basically trading blind.

Why? Because without understanding market structure you could be trading the best trading strategy in the world and still come up short because you haven't identified the underlying behaviour of price.

By mastering market structure, you'll be able to map out the story of the market to determine: Who's in control (Buyers or Sellers), gain clarity over where price is currently trading, whether the trend is likely to continue or reverse and gain more confidence in your entry & exits.

In addition to all of that, Market Structure Mastery will help you align yourself with the right side of the market to increase the risk/reward of your trades and the probability of a trade playing out successfully.

Think of it like this, market structure is the foundation of technical analysis in which we can build trades around, determine our risk management and everything else in between. It should be the first thing any trader maps out on a chart before even considering their entry into the market.

PS - For further guidance please reach out via the Financial Hideout discord by **Clicking this hyperlink.** Additionally, for a step-by-step blueprint teaching you how to become a profitable trader, here's a discounted link to my **e-book**.

Otherwise...

Let's get started!

©

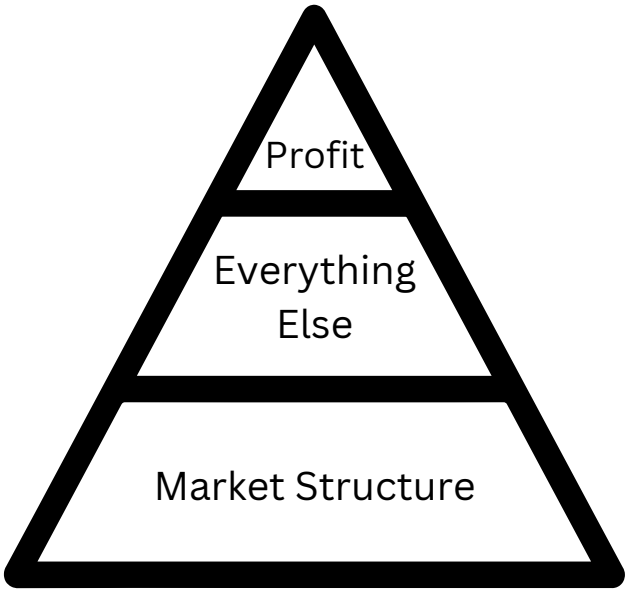

To simplify this guide I've separated market structure into 4 parts:

Part 1: Buyers & Sellers Markets

Part 2: Highs, Lows and Swings

Part 3: Trend Mastery

Part 4: Mapping Structure like a pro

Part 1: Buyers Markets & Sellers Markets.

In this part, I'm going to teach you the simplest method to identify whether the chart you're looking at is controlled by buyers, sellers or neither.

By understanding this concept you'll be able to open up a chart and immediately determine the sentiment of the market as well as who's in control.

Put simply 'buyers market' is just another way of saying 'bull market' a market run buy 'bulls' (buyers). Where a 'sellers market' is just another way of saying 'bear market' a market that is run by 'bears' (sellers). I'll start by showing you a buyers market.

Buyers Markets:

Buyers markets can be defined by positive sentiment from optimistic investors/traders alike. During a buyer's market, the bulls are firmly in control of price.

Price will be making higher highs a higher lows, trading from the bottom left of the screen to the top right. During these markets we'll want to position ourselves with the buyers and look for long trades, we'll talk more on that later, for now here's an example.

Sellers Markets:

Seller's markets can be defined by negative sentiment from cautious investors/traders alike. During a seller's market, the bears are firmly in control of the price.

Price will be making lower lows and lower highs, trading from the top left of the screen to the bottom right. During sellers markets, we'll want to look for opportunities to short the market. Here's an example of what a sellers market looks like:

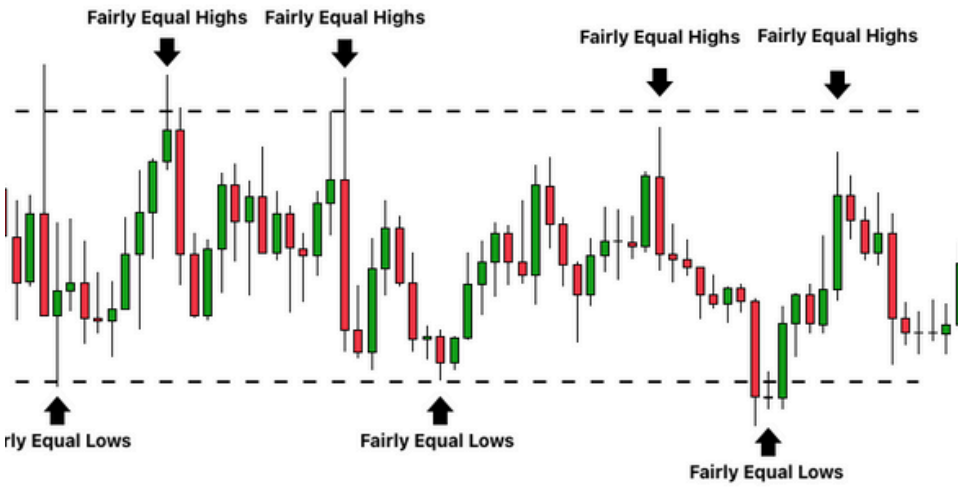

Ranging Markets:

In ranging markets, neither buyers nor sellers are in control, resulting in balanced sentiment among investors/traders.

During this phase prices move within a defined range, fluctuating between two price points, reflecting indecision. Traders may capitalise on short-term price movements within the range.

Personally, I tend to avoid trading ranging markets until the next directional move is visible. Due to the lack of momentum and low-risk rewards.

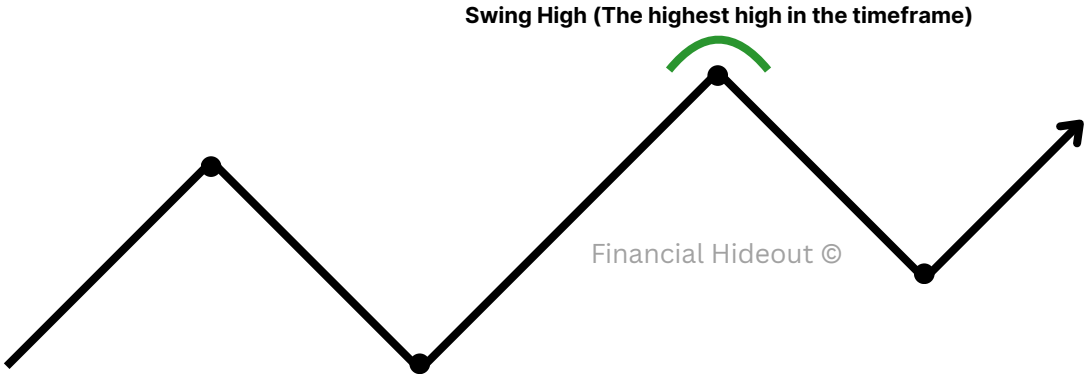

Part 2: High, Lows and Swings

Before we get into part 3: Trend Mastery, let's take a look at how to identify: Swing lows, Swing Highs, Higher Highs, Higher Lows, Lower Lows and Lower highs. We'll begin with Swing Highs and Lows.

Swing Highs:

Swing highs are areas in the market where the price reaches a peak to create a higher high than any surrounding price in the timeframe. These highs are only created when price breaks the prior high to make a new high.

Swing Lows:

Swing lows are areas in the market where the price creates a trough in the market that is lower than any surrounding price. These lows are only created when price breaks the most recent lower low.

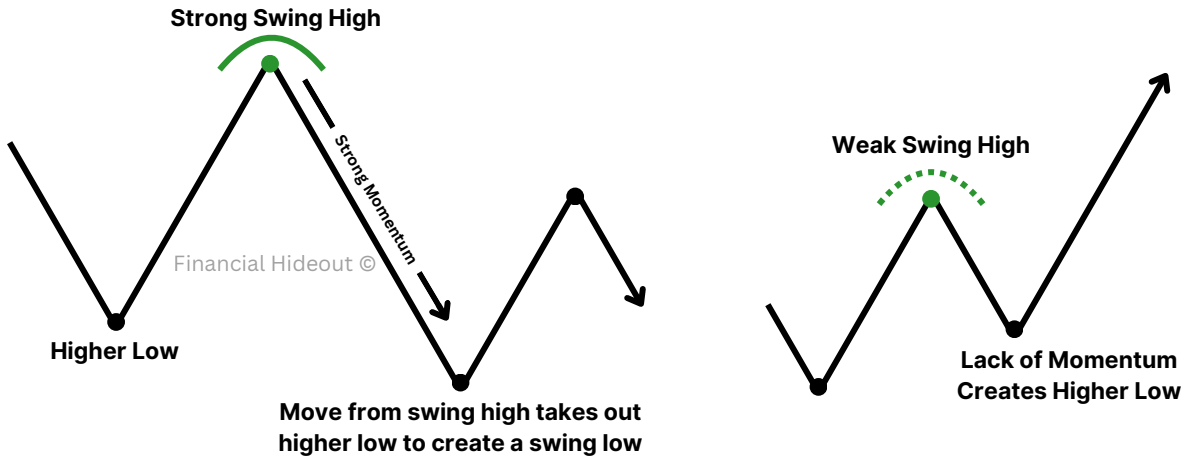

Strong highs & Lows:

To determine whether a swing high or swing low is strong keep this in mind.

A swing highs goal is to create a lower low in the market as the momentum from the high was strong enough to take out the most recent higher low.

Making the high strong. Whereas a weak swing high is one that failed to push price lower resulting in the formation of a higher low, i'll get to why this is important to understand in just a moment.

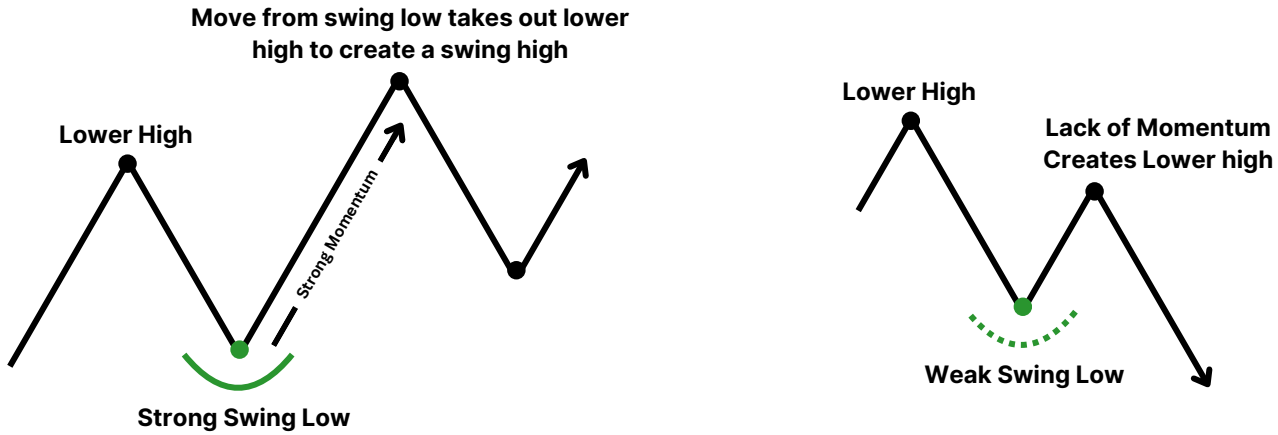

First here's an example of strong swing highs and weak swing highs:

The goal of a swing low is to create a higher high in the market as the momentum from that area was strong enough to take out the most recent lower high.

Whereas a weak swing low is one that lacks the momentum to push the price higher which results in the formation of a Lower high,

Here's an example of strong swing lows and weak swing lows:

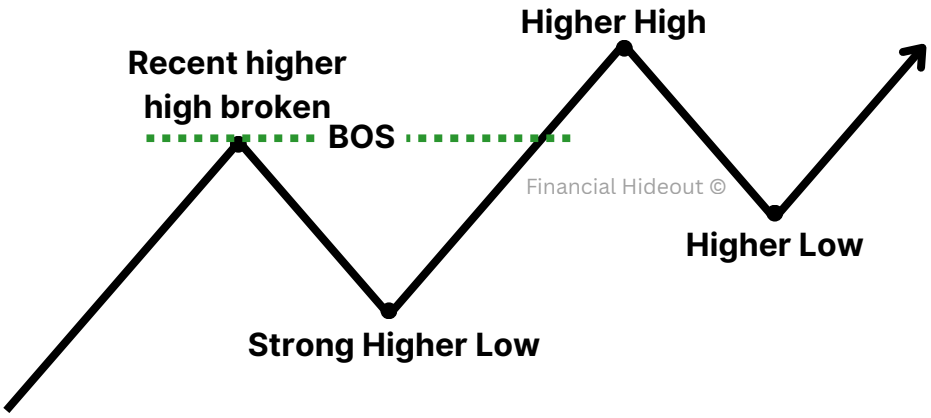

Highs & Lows:

Higher highs are formed in strong trending markets when the price trades higher after the initial swing high. The initial higher high after a swing high confirms a shift in trend and likely a continuation the upside.

Higher lows are formed when the price pulls back after the impulsive move higher that created the higher high.

A Higher low is considered strong when the move from that area was strong enough to take out the most recent higher high, this is considered a break of structure. We'll cover that more in part 3.

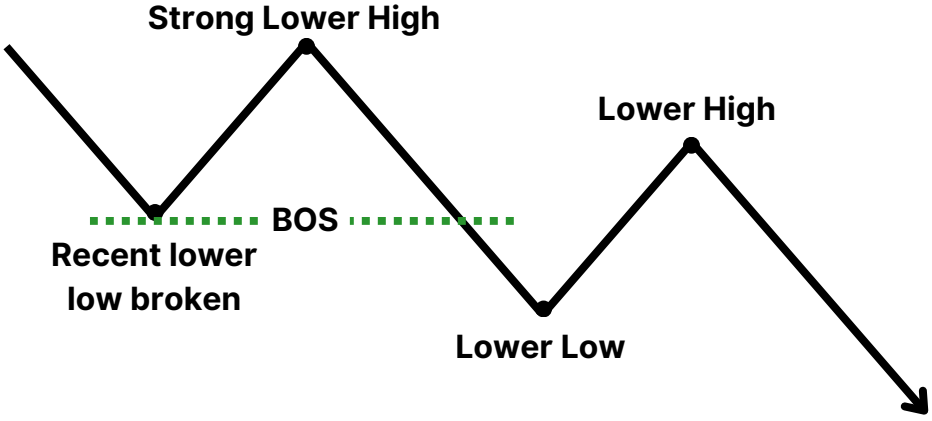

Higher highs and higher lows are considered bullish structure and the faster the move from the low the stronger we can consider it. Let's take a look.

Lower lows are formed in strong trending markets when the price trades lower after the initial swing low. The initial lower low after a swing low confirms a shift in trend and a likely continuation to the downside.

Lower highs are formed when the price retraces upward after the move lower that created the lower low. A lower high is considered strong when the move from that area was strong enough to take out the most recent lower low, this is considered a break of structure. Again we'll cover that more in part 3, where I'll show you how to put it all together for trend identification.

Lower highs and lower lows are considered bearish structure, and the faster the move from the high, the stronger we can consider it. Let's take a look.

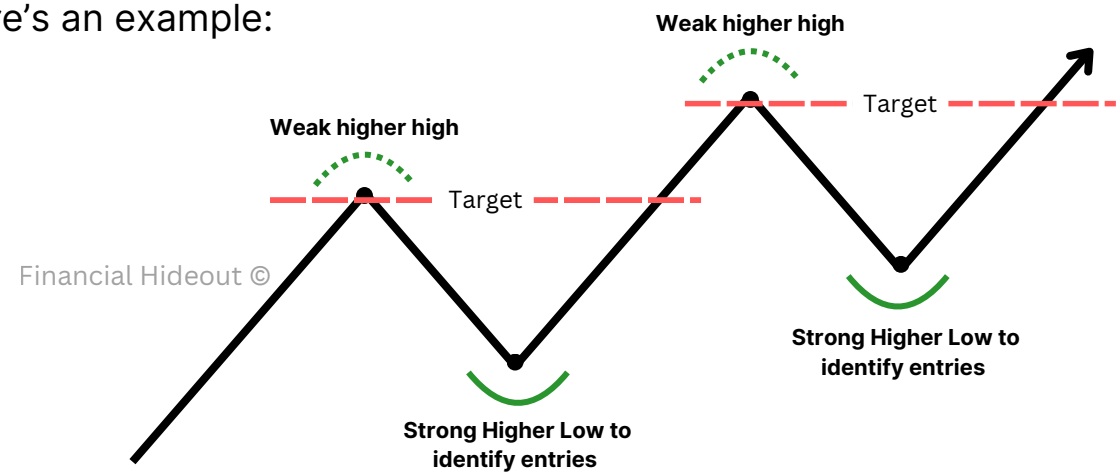

Importance of Strong/Weak Highs & Lows:

The importance of understanding highs and lows in the market allows us when trading to determine weak areas in the market to target and strong areas to build our trades around. Whether it's price patterns, supply & demand, or support/resistance by understanding the most significant points in the market we can increase our strike rate when planning trades.

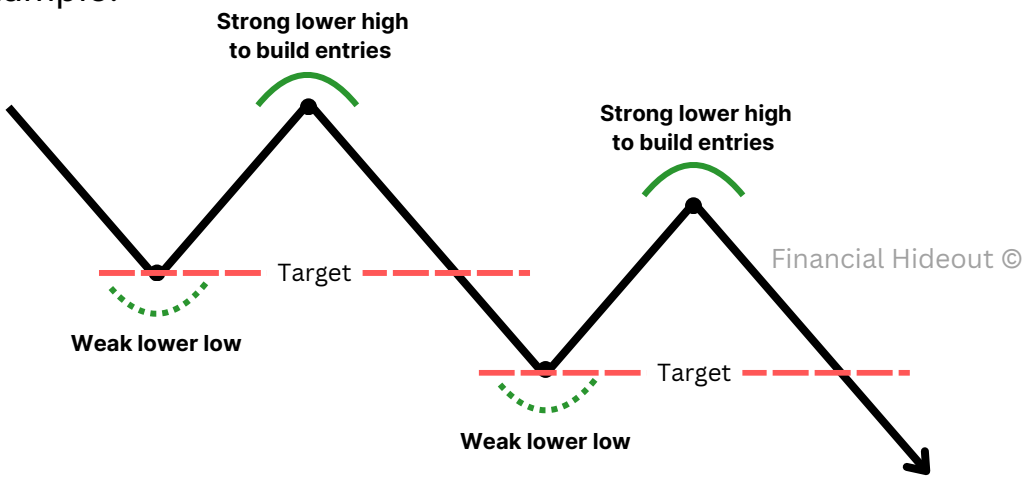

Key trading tips when it comes to highs & lows:
In a buyers market, I like to target weak highs from strong lows. What this means is building entries around a strong higher low and then targeting a take profit at last weak high where price is likely to be more reactive.

Here's an example:

In a sellers market, I like to target weak lows from strong highs. What this means is building my entry based off of a strong lower high and then targeting a take profit around the most recent lower low.

Here's an example:

If you need a repeatable and proven strategy to profit from moves like this check out my snipers' strategy at the end of this guide.

Part 3: Trend Mastery

Now we've briefly covered some of the concepts of defining market structure in part 1 and 2 of this guide, but in this part, i'm going to dive deep and show you how to master trend identification so you can level up your entries/exits, improve your risk/reward for trades and align yourself with the right side of the market before stepping into a trade.

Part 3 will show you how to put it all together in one value-packed section, here's what we'll cover.

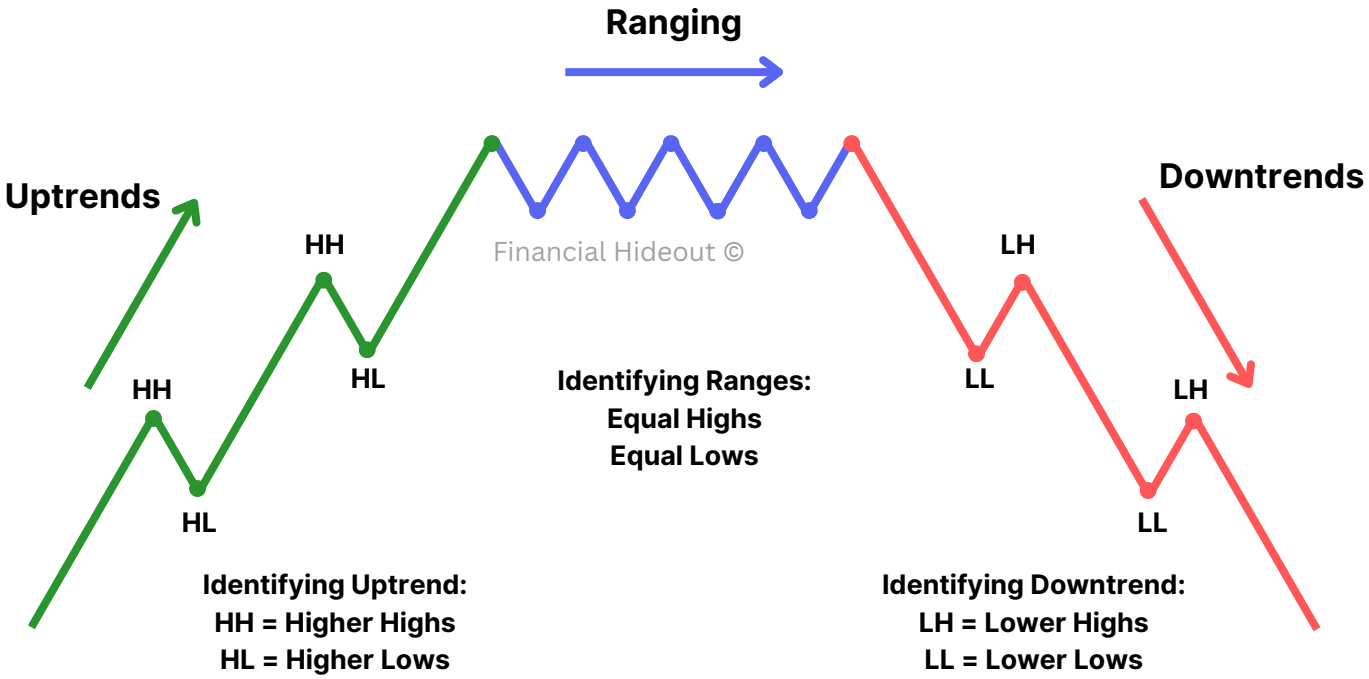

Financial Hideout ©

1) Identifying Trends.
2) Drawing Trends.
3) Break of structure (BOS).
4) Change of Character (Choch).
5) Trend Changes.

Let's get started.

Identifying Trends:

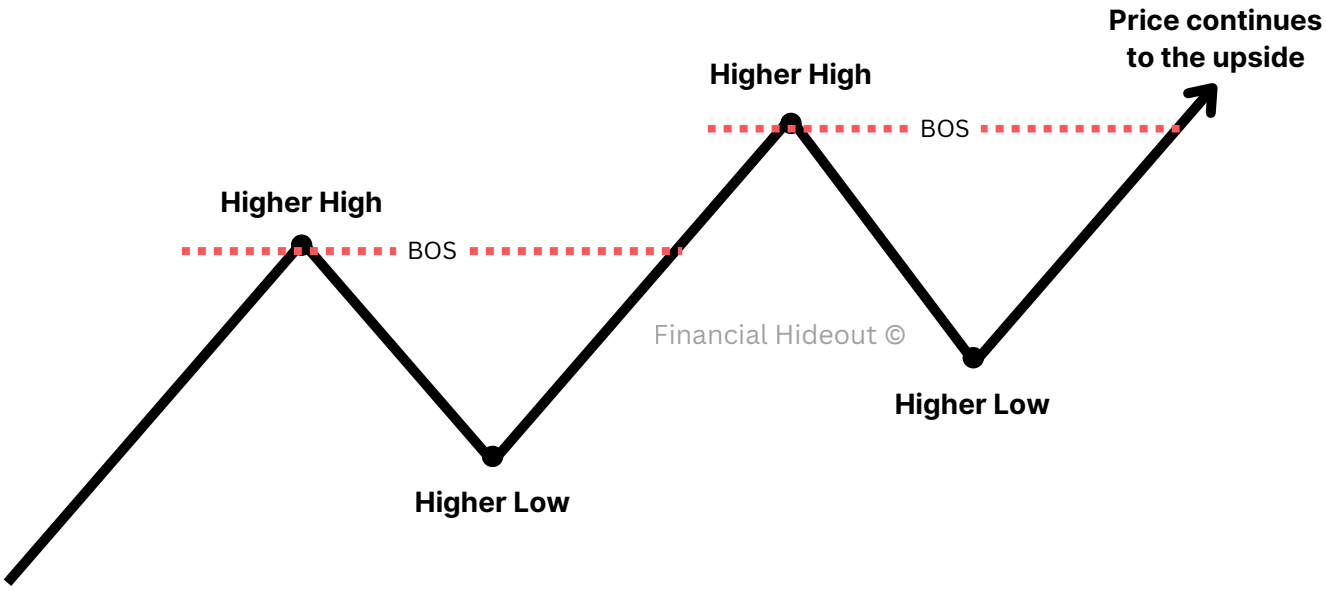

Whether you're trading crypto, stocks, futures, options, commodities or forex you're always going to find price in 1 of 3 periods: Uptrend (Buyers markets), Downtrend (Sellers Markets), or Ranging (Neutral Markets).

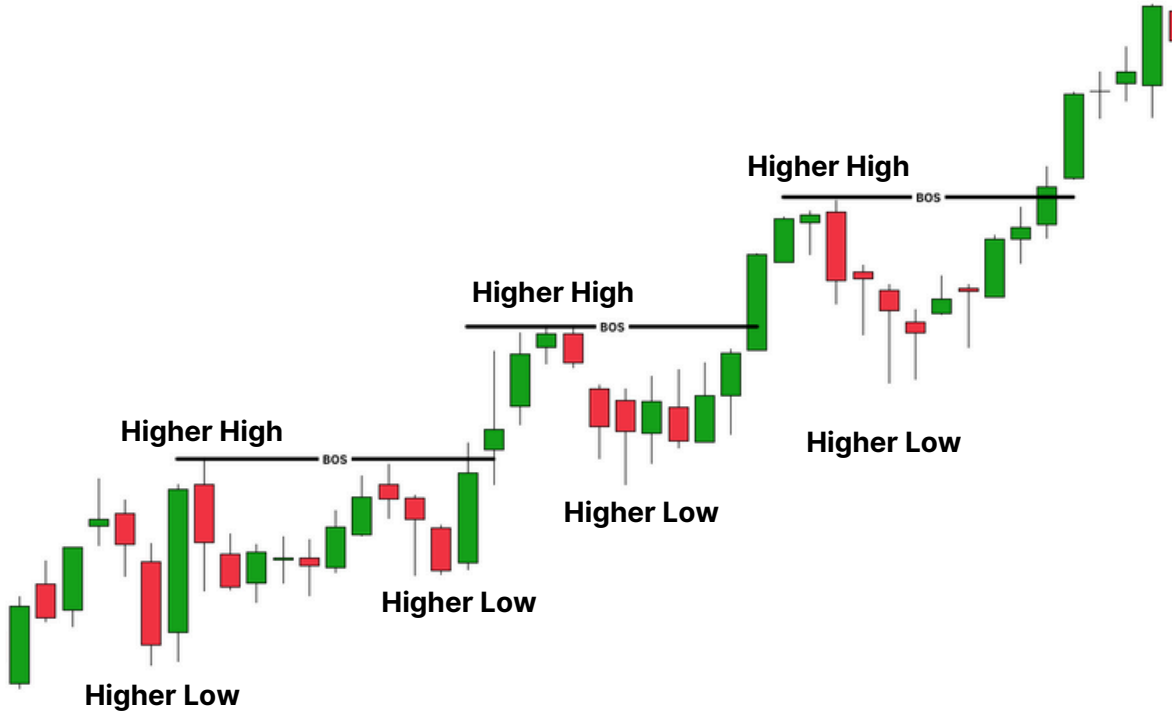

Identifying uptrends:

Uptrends (Bullish market structure) are categorised by a series of higher highs and higher lows. During strong uptrends price rallies from higher lows will take out the most recent higher high to create new highs, this is deemed a break of structure. During uptrends, traders often look for opportunities to align ourselves with the trend by identifying entries into long trades.

Example of a perfect uptrend:

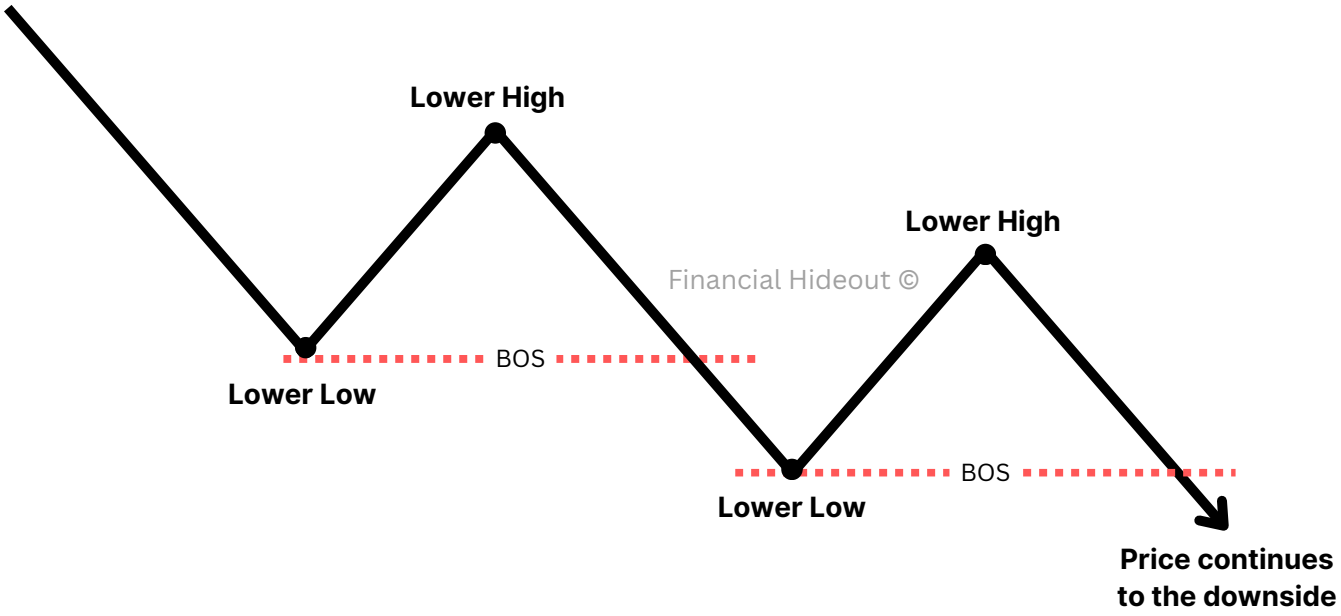

Example of a an uptrend in reality:

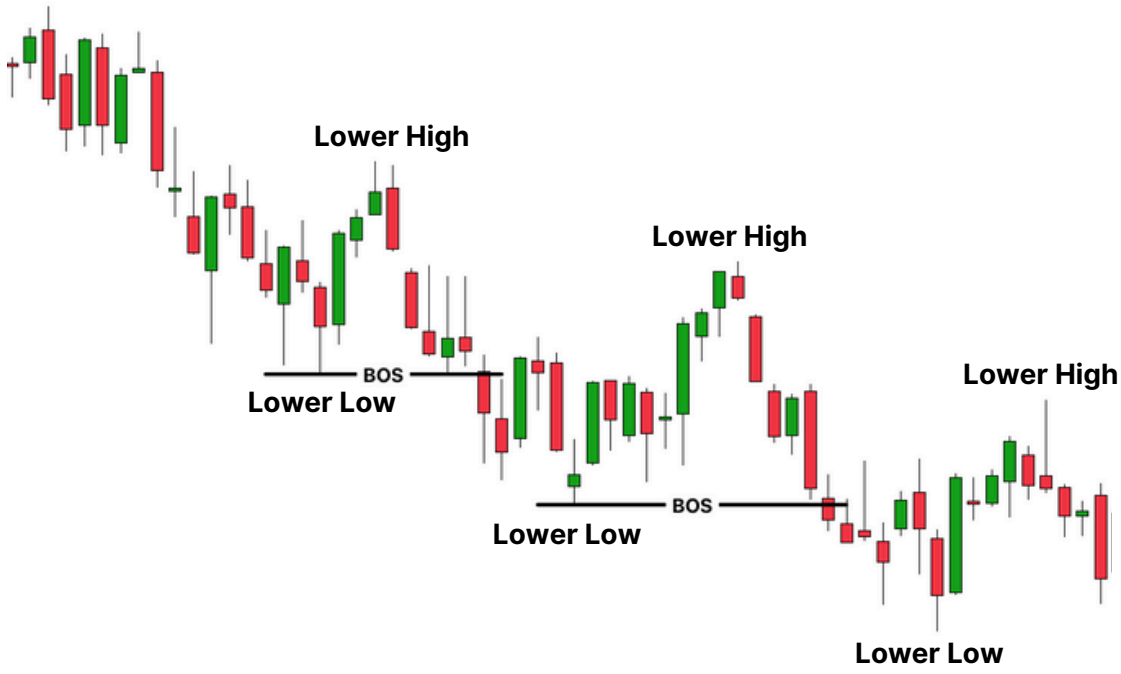

Identifying downtrends:

Downtrends (Bearish market structure) are characterised by a series of lower highs and lower lows. During strong downtrends, price declines from lower highs will penetrate the most recent lower low to establish new lows, signaling a break of structure. In downtrends, traders frequently seek opportunities to align ourselves with the downward trend, identifying entry points for short trades.

Example of a perfect downtrend:

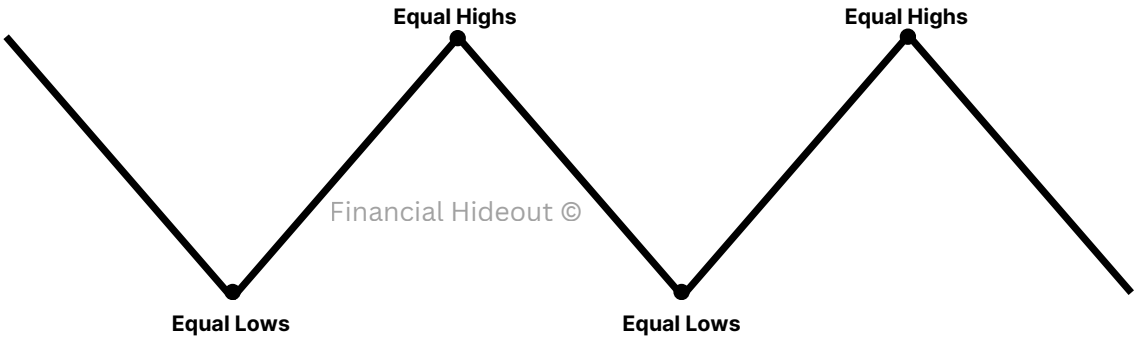

Example of a an downtrend in reality:

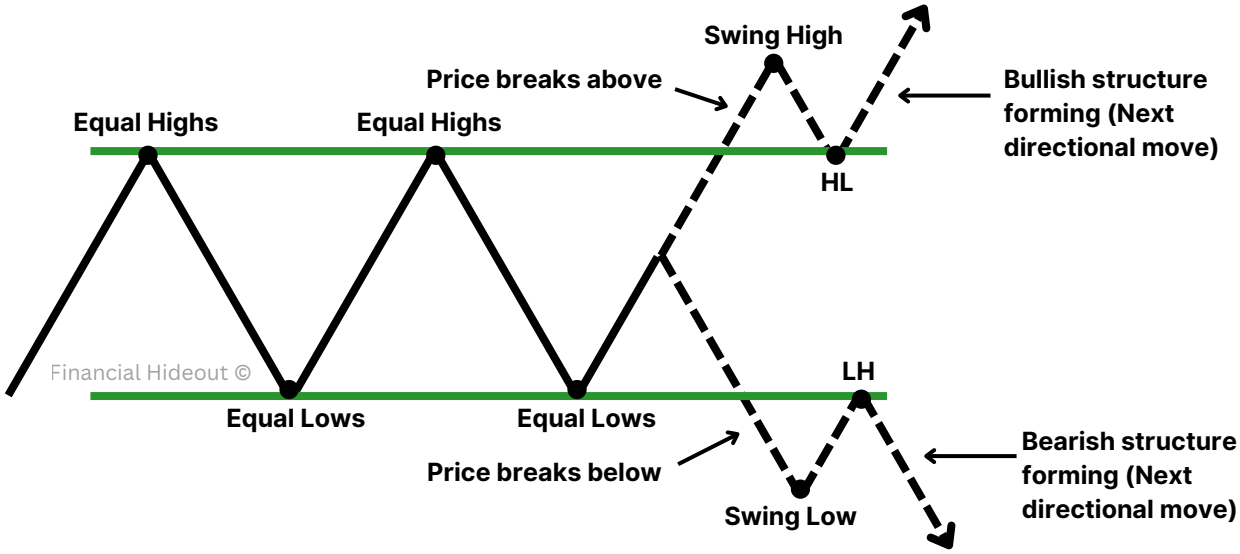

Identifying ranging Trends:

Ranging markets (Neutral market structure) are characterised by a lack of direction, with price trading within a defined range. In sideways markets, price movements often fail to establish significant higher highs or lower lows, resulting in a consolidation pattern. Personally, for reasons stated earlier in this guide, I avoid them until the next directional move. If you're looking to profit in ranging markets I break down a profitable strategy in the *'Traders Execution Journal'* see page 27 for details.

Here's an example of a ranging market:

Identifying the next directional move/defined structure forming:

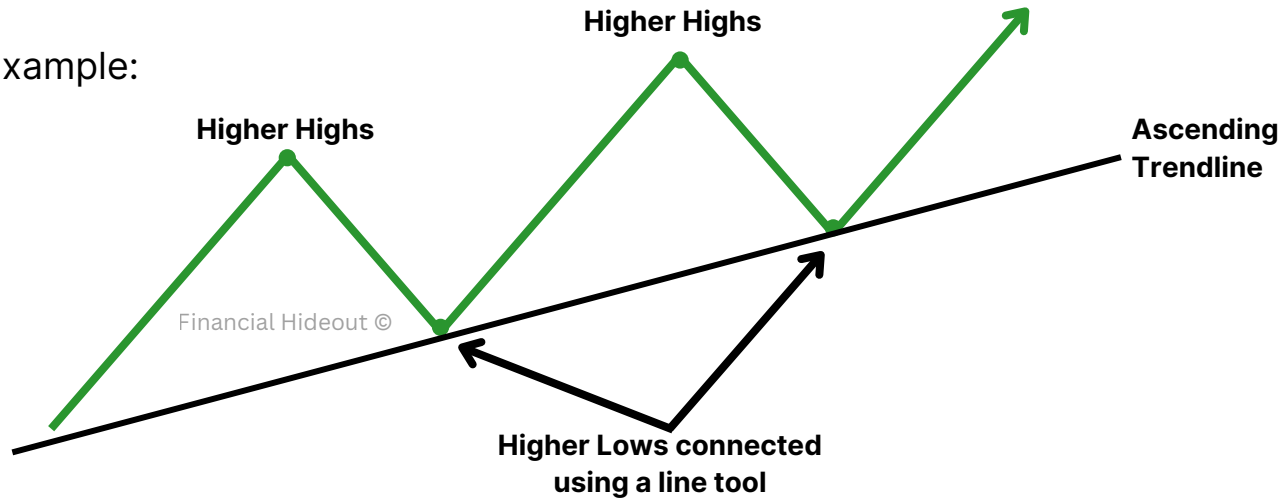

To identify a shift from neutral structure to bearish structure first identify a price move that breaks below the most recent low of the range to form a swing low. Next, wait for price to form a lower high (LH). This second layer of confirmation signifies sellers taking control of the market.

For neutral to bullish structure we need to watch for a break above the most recent high of the range to form a swing high then wait for price to make its first higher low (HL). This tells us buyers have overwhelmed sellers to take control of the market, be carful of fakeouts i'll cover those in just a moment.

Marking trends on a chart:

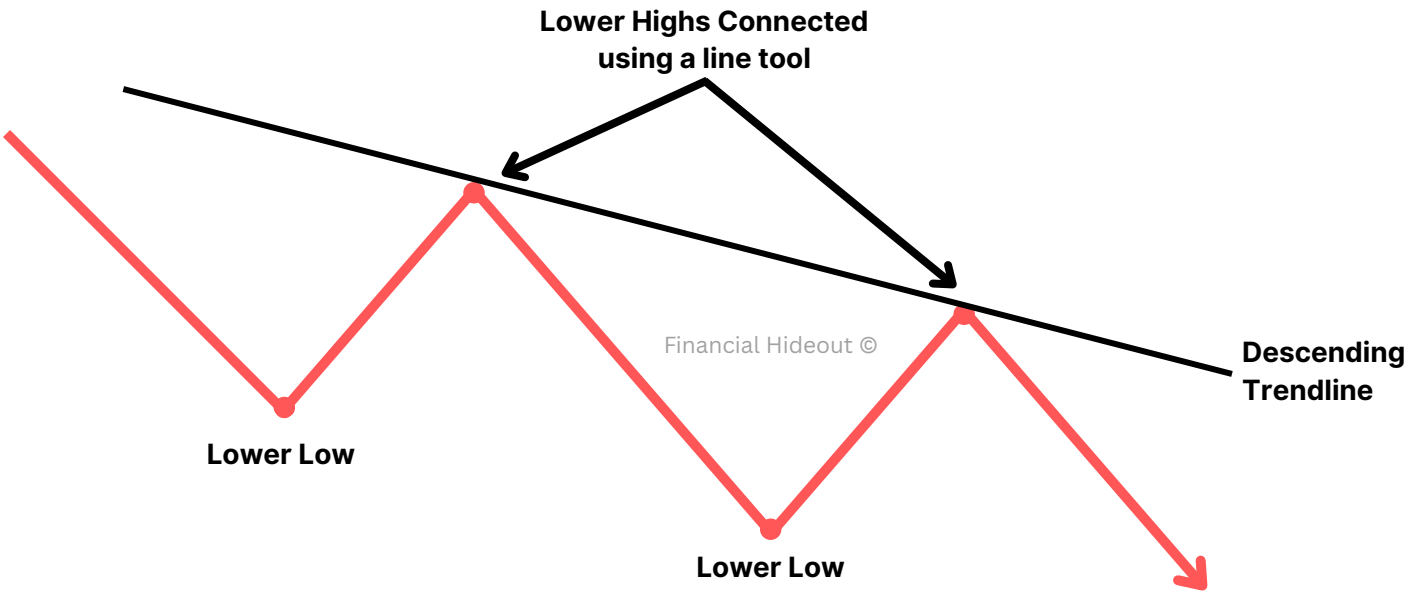

To mark uptrends simply take your line tool and connect 2 or more higher lows on your price chart, always take the low of the wick as the point you draw the trendline. This signifies the lowest point price can trade before breaking the trend. Once you have the trendline drawn you can use it to forecast future price movements and build trades off of. I breakdown a couple of profitable strategies I use in the *'Traders Execution Journal'*, want more info? - see page 27

Example:

To mark downtrends, simply use your line tool to connect 2 or more lower highs on your price chart, always taking the high of the wick as the point to draw the trendline. This signifies the highest point price can trade before breaking the trend. Once you have the trendline drawn out, you can use it to forecast future price movements.

Example:

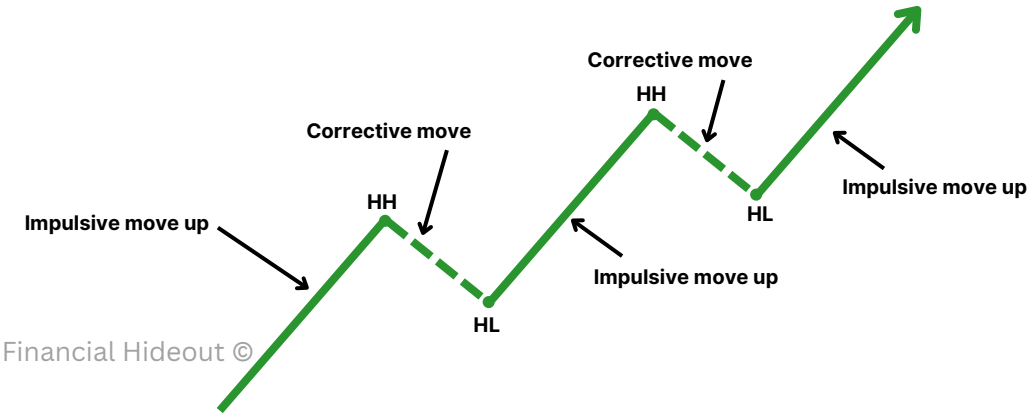

Price behaviour during trends:

Before getting onto fakeouts let's quickly look at the behaviour of price during a trend. When it comes to analysing trends it's important to understand that most of the time prices won't just skyrocket to the upside.

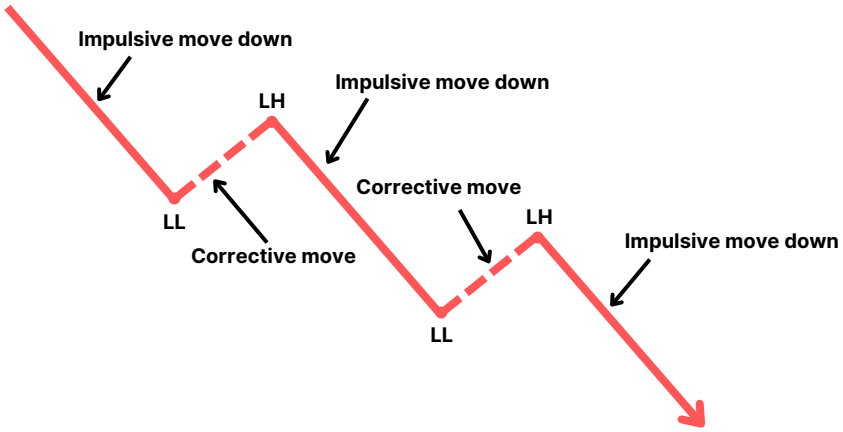

This means a strong trend can be categorised into two stages. The first stage is known as the impulsive move this is the initial run in price. The second stage is a short corrective phase where the price will cool off before continuing the next leg of the trend.

The corrective phase in trends is caused by either buyers or sellers entering the markets and even traders taking profits. Let's look at a few examples.

Impulsive + Corrective stages during an uptrend.

During uptrends, corrective moves can be identified as pullbacks to support to create a higher low. Once the price establishes a new higher low price will begin another impulsive move to the upside and repeat the process until the trend is exhausted. I'll teach you a couple simple way to determine when a move is finished in just a moment, first here's an example of the impulsive + corrective stages during a downtrend:

During downtrends, corrective moves can be identified as short retracements to resistance to create a lower high. Once price establishes the lower high price will begin its impulsive move back to the downside if the selling pressure is there and the trend is strong. Price will repeat this process until the trend is exhausted.

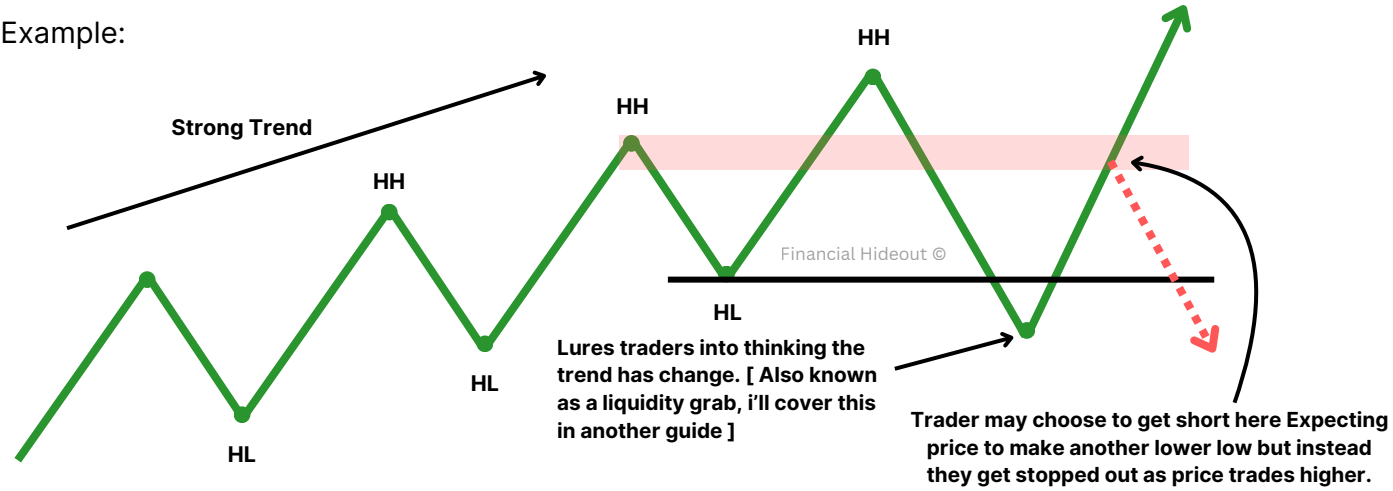

These corrective phases are a great time to look for entries into trades that align with trend. This can be done through a number of methods like: Price patterns, Supply & Demand, or Reversal candlesticks. All strategies that are covered in the '*Traders Execution Journal*', for now, let's take a look at fakeouts.

Fakeouts and false trend breaks:

Trends in the live markets won't always be perfect and will sometimes fake traders out with false moves.

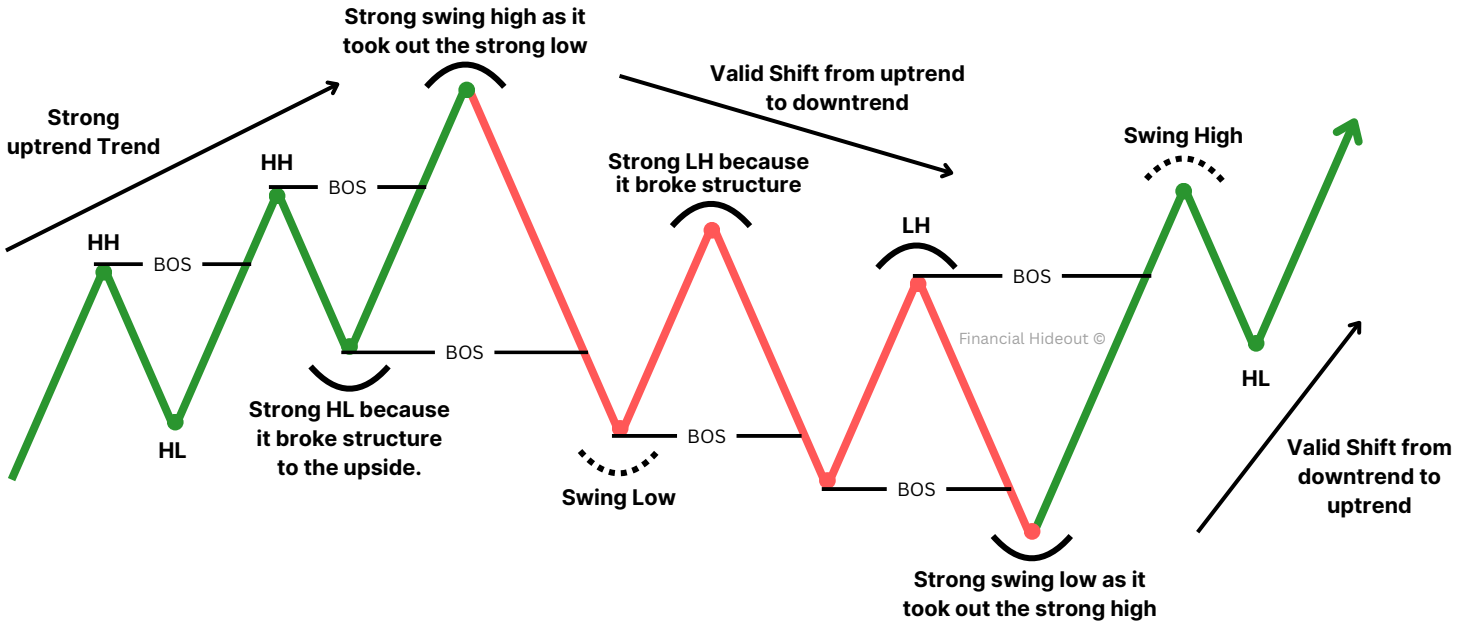

What this means is during an uptrend where price is making higher highs and higher lows, the price may break below the most recent higher low to grab liquidity then trade back in the direction of the original trend. This initial move lower to the untrained eye may cause traders to look for shorts at the next opportunity under the assumption the uptrend has reversed after the formation of the lower low but end up getting stopped out. The opposite can be said in downtrends.

Example:

This is what we would call a bear trap (In a downtrend it would be called a bull trap) It occurs during strong trending markets where price will lure sellers into thinking the trend is exhausted and about to change given the lower low formed so they enter short trades but ultimately get stopped out when price reverses back in the direction of the prior trend (Trapping traders in a trade on the wrong side of the market.). This is what we can deem a false trend or fakeout.

A simple fix to avoid this is waiting for a trend change by confirming 2 factors. In an uptrend, a downtrend forms when price takes out a strong higher low from a higher high to form a new swing low followed by a strong lower high. In a downtrend, a shift to an uptrend occurs when price takes out a strong lower high to create a new swing high followed by a higher low.

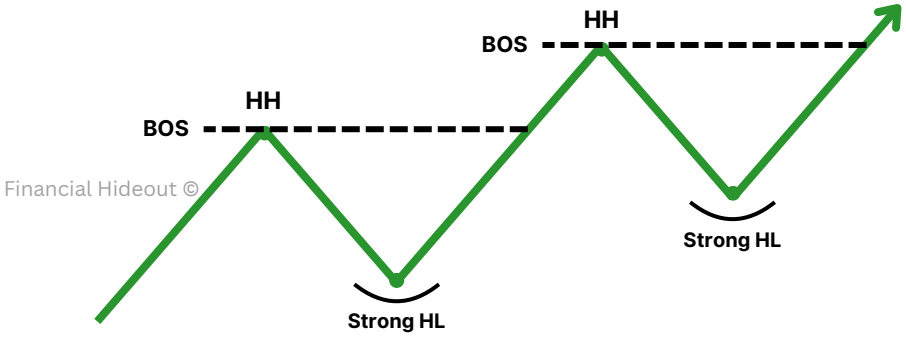

Break of structure & Change of Character:

There are 2 key terms you're going to want to know when it comes to identifying strong trends and identifying shifts in market structure and they are a change of character (choch) and breaks of structure (BOS). Let's start with a break of structure.

Break of Structure:

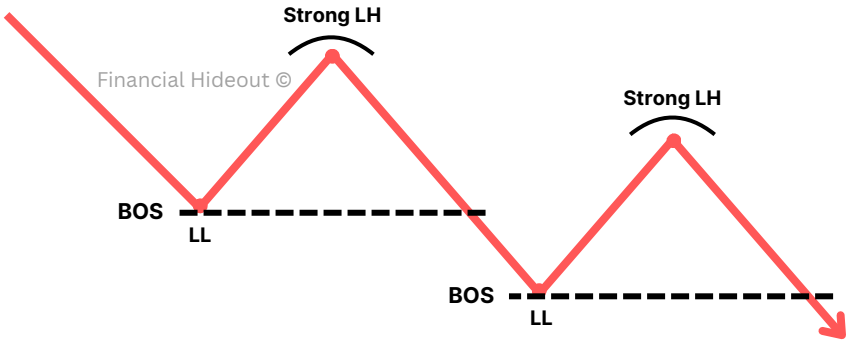

During this guide I've mentioned this term quite a lot 'BOS' so let me take a moment to break it down in detail how to use them to correctly identify continuations in trend as well as strong and weak lows & highs.

Firstly what is a break of structure? A break of structure in an uptrend occurs when price moves higher from a higher low to take out the most recent high. What this indicates is the trend is strong and likely to continue to the upside making the low a strong low.

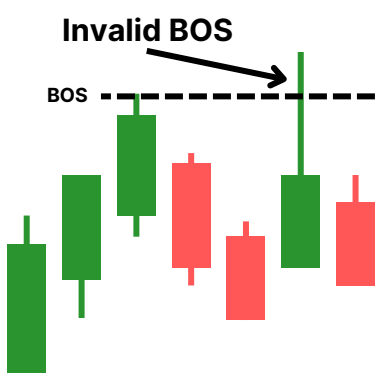

(For a bullish BOS a candle MUST close above most recent high.)

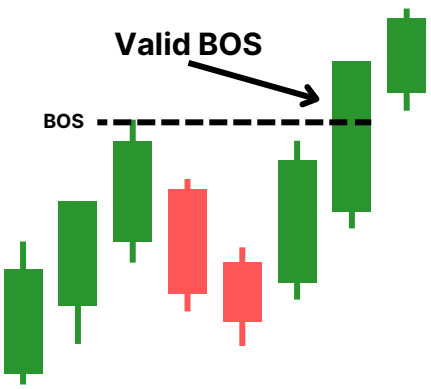

A break of structure in a downtrend is a price move from a lower high that trades down to take out the most recent lower low to form new lows. This indicates a strong downtrend and likely continuation of the trend to the downside making the high a strong high.

(For a bearish BOS a candle MUST close below most recent low.)

What defines a break of structure? A valid break of structure occurs when a candle breaks and closes above (In an uptrend) or below (in a downtrend) the most recent higher high or lower low. A wick above or below is not a valid break of structure. Here's what that looks like:

After a break of structure occurs price is likely to pull back to an area of support (in an uptrend) or resistance level (in a downtrend) before continuing on its respective trend. This is deemed a short corrective move after price makes its impulsive move up. Think of it as a little cool-off period where traders take profits and re-position themselves before the next leg in the trend. To find entries during these corrective phases I like to look for entries from supply & demand zones that align with the trend.

Key = Trade strong structure to weak structure.

I've compiled a complete guide on the supply and demand strategy I used to achieve a 67% win and the trading plan that helped me 10x a small trading account within just 2 months. Stick around till the end to find out more.

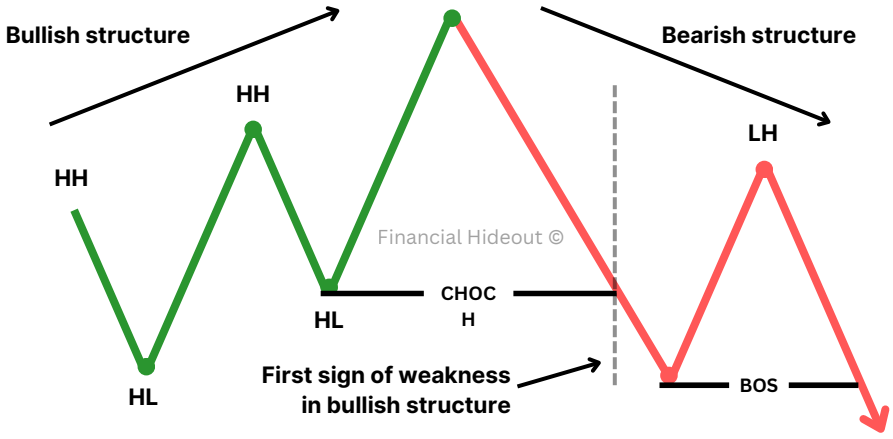

For now, let's take a look at change of characters and how to correctly identify them.

Change of Character:

A Choch acts as the first sign of weakness in structure, signalling either the early signs of bullish structure shifting to bearish structure or bearish structure shifting to bullish structure.

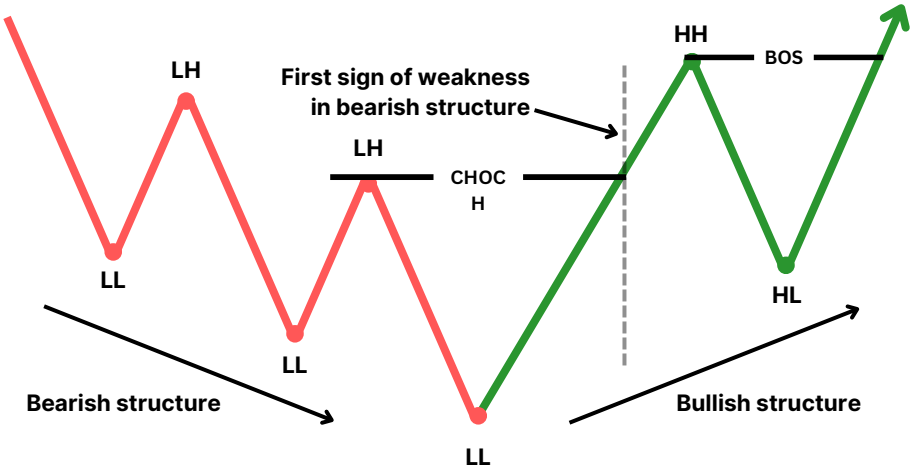

A choch from bullish to bearish can be identified when price trades below the most recent higher low. This would tell us to stop looking for longs as the bullish move may have finished. We can confirm this when price make a new lower high to form bearish structure.

Example =

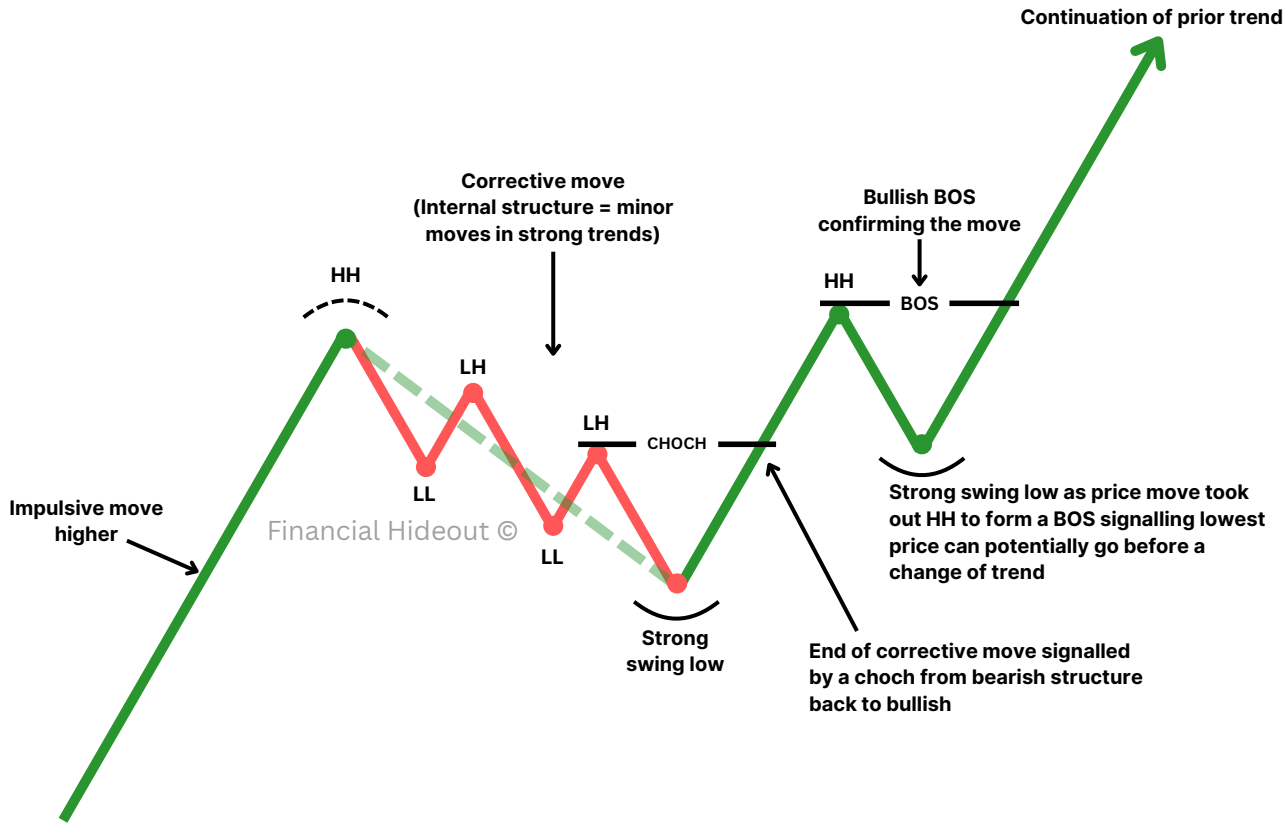

A choch from bearish to bullish can be identified when price trades above the most recent lower high. This would tell us to stop looking for shorts as the bearish move could be over. We can confirm this when price makes a new higher low to form bullish structure.

Example =

The concept of change of character itself is very similar to a change of trend but there's one small differentiation you can use. Imagine a change in trend as a change of the overall market structure where price takes out swing structure in a higher timeframe. Making a choch a change of the internal structure.

To put this in perspective think back to the impulsive and corrective moves that are used to define trends. A choch can be used to anticipate the end of the corrective move (Internal structure) inside of the larger trend and the continuation of the prior trend.

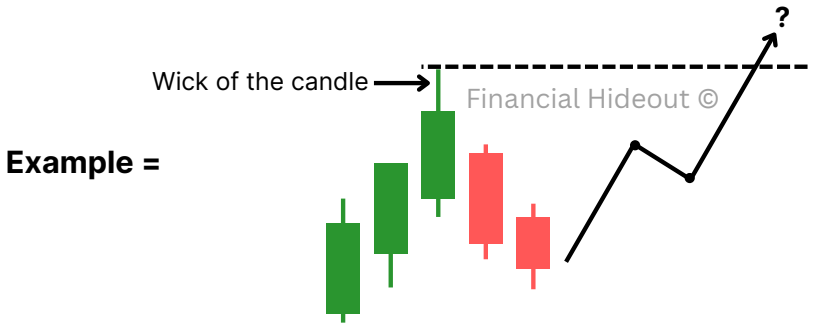

Part 3 Summary:

- Uptrends are characterised by higher highs and higher lows, they tell us that the market is currently run by buyers.
- Downtrends are characterised by lower lows and lower highs, they tell us that the markets are currently run by sellers.
- Sideways structure develops when the price trades between equal highs and equal lows.
- To draw descending trendlines connect a series of lower highs.
- To draw ascending trendlines connect a series of higher lows.
- Trends are created by impulsive and corrective moves in the markets.
- Entries into trades can be found during corrective phases.
- To identify a change in trend wait for the price to put in a lower high and lower low (Uptrend to downtrend) or wait for the price to put in a higher high and higher low (Downtrends to uptrends).
- A break of structure occurs when price takes out the most recent higher high (Uptrends) or Price takes out the most recent lower low (Downtrends)
- Change of charater can signal then end of a corrective move or the early signs of a reversal.

Part 4: Mapping Structure:

By now you should have a solid base for identifying market structure but to really help cement the process there's 1 key thing I want to cover before we get onto what to keep in mind when analysing structure and a breakdown of the steps to take when it comes to opening up your chart.

The 1 key thing any aspiring technical analyst should keep in mind when it comes to drawing structure is... Always draw structure from the wick of the candle. I like to do this because it signifies the absolute high or low a price can trade before either breaking structure or changing character. Once identified extend the line tool to the left to project where price is likely to trade.

What to look for:

Identify strong highs and lows in price.

Look for weak areas in the market to target.

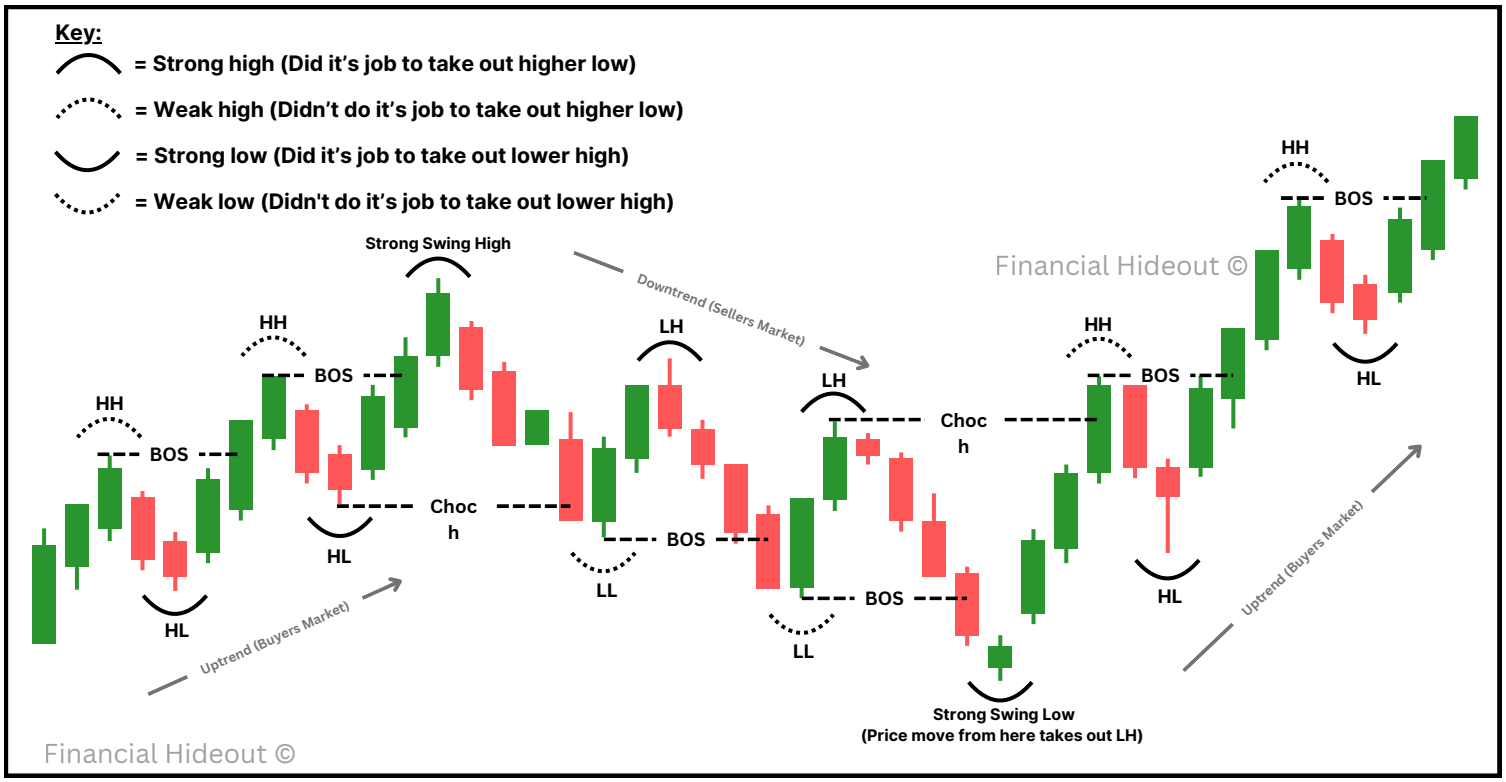

Determine the most recent swing range to identify trades.

Is there any significant reversal points.

What way is the market trading?

Is the price currently in an impulse phase or a corrective phase?

Determine strong entry points.

3 Step Structure Mapping Process:

1 - Who is in control?
First things first... who's in currently in control of the market, Buyers or Sellers?
open up the timeframe 2 or more periods higher than the one your trading, I personally like the 4 hour or the daily. Once in the chart, identify whether price is making higher Highs (buyers in control), or lower lows (Sellers in control). If you need better clarification of the direction of trend, use the line tool to mark off an ascending or descending trendline.

2 - Lower timeframe analysis:
Now move down into the timeframe you're trading to set up your market structure. Mark off the highs and lows to begin building the story/behaviour of price, next identify any BOS + CHOCHS to determine which highs + lows are strongest/weakest. By understanding this we give ourselves areas to build entries and exits around later where price is likely to be most reactive. (If you need a proven strategy you can apply today, i've got something special for you at the end of this guide that others are getting fantastic results with.)

Financial Hideout ©

3 - Aligning ourselves with the market:
A key factor to why some traders are more successful than others is that the succesful ones are focussing on higher probability trades that have a greater chance of paying off, therefore having greater success. To adopt this method for yourself you'll want to align yourself with the momentum of the market. To achieve this identify entries into trades / trade set ups that align with the market in both the higher and lower timeframe. For example if you identify buyers being in control of the market look for entries into long trades in bullish structure.

Key considerations:

- Price will not always follow the story you map out: When it comes to marking market structure, it is important to understand that just because you've drawn something on a chart it doesn't mean price has to follow it. Market structure can only offer us clues to what might happen it is up to us to build the trade around the market and tilt the odds in our favour as much as possible.

Financial Hideout ©

- Always trade what you see: Always trade what you see and not what you hope will happen. For example, if the market is trading up, the logical thing to do would be to look for trade entries to trade with the market higher

- Keep a trading journal: When mapping market structure you may see something interesting or a trade developing. To stay on top of this grab a journal to start building a watchlist. After a trade always log the details of the trade from the set up to the take profit to see if you can identify anything that can be improved. '*The Traders Execution Journal*' includes a cutting-edge trading journal you can use to stay on top of all the data.

- If you're looking for long trades in a buyers' market but the structure signals a change, avoid entering the market until the new structure is clear.

Congratulations, on completing the Market Structure Mastery Guide

The Traders Execution Journal:

The Ultimate Guide To Turn Trading Into A Second Source of Income in 2024.

The Traders Execution Journal is designed for traders looking to take their technical analysis skills from complete beginner to profitable trader in less than 30 days. If you're serious about trading and want in-depth breakdowns of instantly applicable trading strategies this guide is for you!

✅ **Technical Analysis Masterclass:**
Gain access to the traders' execution journal. A 200-page PDF guide that will teach you everything you need to know about technical analysis without the 3-4 years of research.

✅ **Multiple Profitable Strategies:**
Gain access to multiple profitable trading strategies alongside the supply and demand profit snipers strategy you can implement today to start generating profitable trades for yourself.

✅ **Risk Management Mastery:**
Learn multiple methods to manage your risk, effectively position size, protect your capital and grow your trading account. + So much more.

✅ **Bonus #1 Discord Community Access:**
Gain Access to the Financial Hideout members vault before our official launch so you can grow alongside the community. (Lifetime Access)

✅ **Bonus #2 Cutting Edge Trading Journal:**
Gain access to The Traders Companion a cutting-edge trading journal you can use to automate the way you track your trades and improve your trading edge.

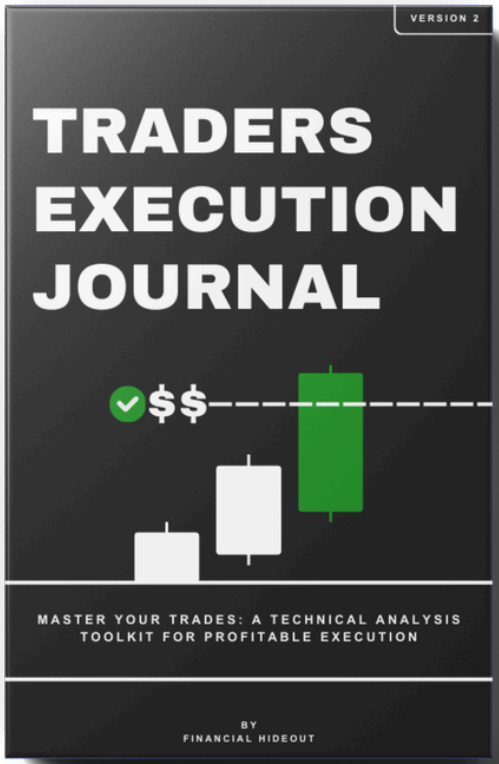

✅ **Bonus #3 Lifetime Updates.**
Stay up to date with every update I make to the guide to ensure you have the best knowledge out there. (Last update I added 90+ Pages)

✅ **Bonus #4 Over 30+ Case studies.**

✅ **Bonus #5 Money Back Guarantee.**

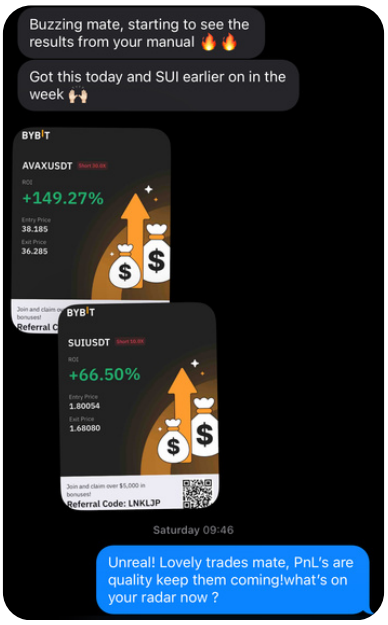

✅ **Bonus #6 Cheatsheets and more.**
